

taskIt: The software that makes forward thinking, simple

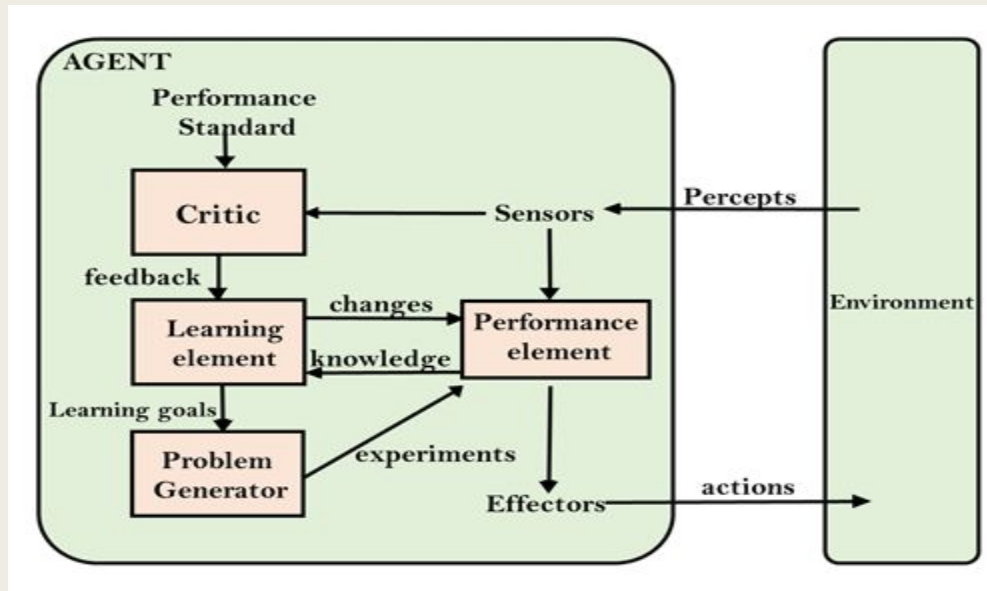

What Is taskIt?

- TaskIt is a Program Made to facilitate time management for students of any age range or level of education.
- Using input variables, such as one's schedule, work hours, and a few questions asked upon the first opening of the app, it generates a schedule, partitioning your study for each class, taking into consideration how comfortable one is with any given class as well as the weight of one's class if applicable.
- This means that the program will allot more time during study breaks to classes worth more, and classes that one struggles with more than others (determined in the survey).

taskIt Machine Learning

- The objective planned for the AI in our application is that it would be an AI with a learning agent, allowing it to adapt to one's schedule by gathering information for a 1 to 2 week period, then re evaluate the initial schedule generated from the small survey at the beginning based on the inputs gathered from daily habits it monitors.

Features

- Inputs:
 - Class Schedule
 - Extra Curricular Activities
 - Transportation time
 - Eating Brothers
 - Phone Usage (App Usage)
 - Homework
 - Exam Dates
 - GPS
- Outputs:
 - Generates schedule that can be used as a widget
 - reevaluates schedule after a probationary period of 1-2 weeks

What We Accomplished

- We were able to design the part of the code that generates the hours each class should be studied per day, as well as the part of the code that reads the schedule from a text file.

What We Wished We Had Accomplished

- Unfortunately, due to both lack of time as well as our limited programming experience, we were unable to implement an AI into our program, and only got as far as creating the survey and taking the user's schedule as an input through a text file.

Thank You!
